Slide 3: Repo2Cloud's 4-Target Autonomous AWS Engine

Instead of forcing every repository into a single hammer, **Repo2Cloud** inspects your GitHub repository (package.json, Dockerfile, serverless.yml, next.config.*, requirements.txt) **before** deployment and scores all **4 native AWS architectures**:

1. **S3 + CloudFront (OAC):** For static HTML/JS, Vite, React, Vue, and Astro SPAs — 100% private S3 bucket (BlockPublicAcls=true) fronted by CloudFront Origin Access Control (SigV4).

2. **Amazon ECR + ECS Fargate + ALB:** For Dockerized microservices, Express/Fastify/FastAPI servers, and long-running backends — auto-generates a hardened non-root Dockerfile if missing.

3. **AWS Lambda + API Gateway v2 (HTTP API):** For event-driven APIs and serverless handlers — packages an in-memory CRC-32 PKZIP bundle and provisions an HTTP API v2 $default stage.

4. **AWS Amplify Hosting (WEB_COMPUTE):** For Next.js App Router SSR and full-stack apps — auto-generates amplify.yml and provisions an Amplify compute branch.
